Sperm freeze(K)it

Home sperm freezing kit

They choose when and how they prefer to do it

HOME SPERM FREEZING KIT

Institut Marquès has developed a new system so that men can cryopreserve their sperm wherever they are.

This procedure facilitates the sperm sample collection of those men involved in Assisted Reproduction treatments.

One of the most complicated steps for men during the assisted reproduction process is the semen sample collection for its use in In-Vitro-Fertilisation or Artificial Insemination.

Many men experience these moments as stressful situations with a lot of pressure that, furthermore, obliges them to travel if they happen to be far from the clinic.

Nowadays, thanks to the home sperm freezing kit, patients involved in an Assisted Reproduction treatment only need to visit the clinic for the embryo transfer.

They can have a first consultation with the doctor through videoconference and use the new home sperm freezing technique to ship the sample. This means a significant time saving, since you do not need to travel.

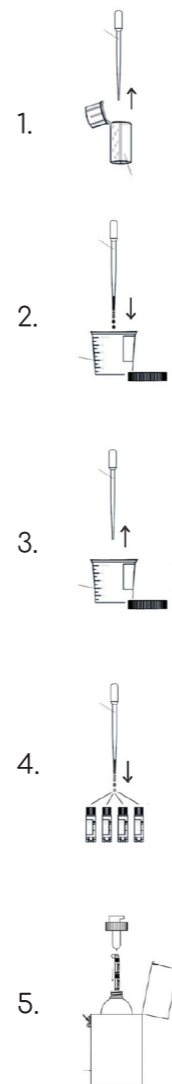

COMFORTABLE, EASY AND SAFE

Institut Marquès
exclusive service

Patented product

The shipment is adapted to the patient's agenda, so that he can choose when to send the sample. It is a convenient, safe, easy to use alternative for men who prefer to collect the sample in the privacy of their home and share this part of the Assisted Reproduction process with their partner.

THEY CHOOSE WHEN AND HOW THEY PREFER TO DO IT

On the other hand, this sperm self-freezing kit is also a new solution for those men wishing to preserve their fertility, for instance before undergoing a vasectomy or an oncological treatment. In addition to that, this method is also useful for those men whose sperm needs to be studied, for instance for chromosome analysis purposes (FISH).

The new kit is shipped directly to the address provided by the patient. On the chosen day, he will receive a nitrogen tank where he will find everything necessary for the sperm cryopreservation, as well as detailed instructions and the description of the steps to follow.

The procedure is quick and simple. The patient has 48 hours to send back his sample once cryopreserved in the interior of the tank. The delivery company will pick it up at the appointed address in order to have it delivered to the clinic.
